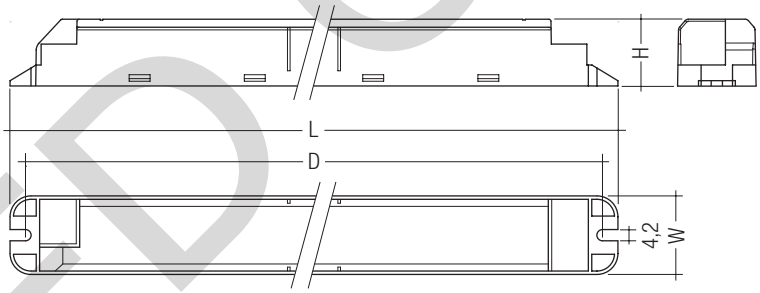
T5

PC T5 TEC, 14 – 28 W

PC TEC T5

Product description

- CELMA Energy Efficiency Index A2
- Nominal life time up to 30,000 h (at ta 50 °C with a failure rate max. 0.3 % per 1,000 h)
- Large temperature range (for values see table)
- Reduced lamp preheating for min. 5,000 starts without replacement of lamps (3,000 for 1x14 W and 1x21 W applications)
- Automatic start after replacement of defective lamps (details on page 4)
- Safety shutdown of defective lamps and at end of lamp life
- Temperature protection as per EN 61347-2-3 C5e



Technical data

Mains voltage range	220 – 240 V
AC voltage range	198 – 264 V
Mains frequency	50 / 60 Hz
Overvoltage protection	320 V AC, 1 h
Time to light	≤ 2 s
Operating frequency	≥ 40 kHz
Type of protection	IP 20

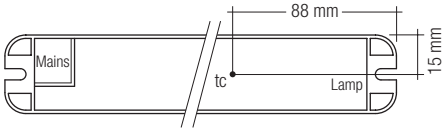
PC 2x14 T5 TEC



PC 4x14 T5 TEC

The tc point is related to the ballast life duration.

PC T5 TEC is designed for an average service life of 30,000 hours under reference conditions and with a failure rate of less than 0.3 % for every 1,000 hours of operation.
Reduced temperature will extend ballast life time.

Humidity: 5 % up to max. 85 %, not condensed (max. 56 days/year at 85 %)

Storage temperature: -40 °C up to max. +80 °C

The devices have to be within the specified temperature range (ta) before they can be operated.

Wiring advice

The lead length is dependant on the capacitance of the cable.
Earthing is not required for the device to operate.
Connection to earth reduces radio interference.

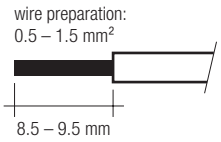
Ballast	Terminals		Maximum capacitance allowed	
Type	Cold	Hot	Cold	Hot
PC 1xx T5 TEC	11, 12	13, 14	220 pF	100 pF
PC 2xx T5 TEC	10, 11, 12	8, 9, 13, 14	220 pF	100 pF
PC 3xx T5 TEC	9, 10	11, 12, 13, 14, 15, 16	220 pF	100 pF
PC 4xx T5 TEC	11, 12, 15, 16, 19, 20	13, 14, 17, 18	200 pF	100 pF

With standard solid wire 0.5/0.75 mm² the capacitance of the lead is approx. 80 pF/m. This value is influenced by the way the wiring is made.
In borderline cases the capacitance must be measured inside the luminaire.
Keep lamp wires short. Lamp connection with twin ballast should be made with symmetrical wiring.
Hot leads and cold leads should be separated as much as possible.

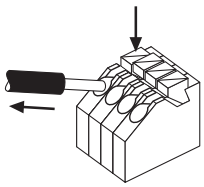
To avoid the damage of the control gear, the wiring must be protected against short circuits to earth (sharp edged metal parts, metal cable clips, louver, etc.)

Installation instructions

Wiring type and cross section
The wiring can be in stranded wires with ferrules or solid with a cross section of 0.5 – 1.5 mm².
Strip 8.5 – 9.5 mm of insulation from the cables to ensure perfect operation of the push-wire terminals.



Release of the wiring
Press down the “push button” and remove the cable from front.

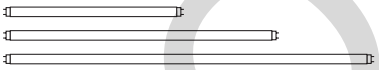


RFI
Tridonic ballasts are RFI protected in accordance with CISPR 15. To operate the luminaire correctly and and to minimise RFI we recommend the following instructions:
- Connection to the lamps of the “hot leads” must be kept as short as possible (marked with *)
- Mains leads should be kept apart from lamp leads (ideally 5–10 cm distance)
- Do not run mains leads adjacent to the electronic ballast
- Twist the lamp leads
- Keep the distance of lamp leads from the metal work as large as possible
- Connect functional earth over the terminal
- Mains wiring to be twisted when through wiring
- Keep the mains leads inside the luminaire as short as possible

Defective lamp
(Broken Filament, Rectifying Effect, Gas Defect)
If a lamp is defective then the ballast will either switch off and go into the stand-by mode or it will continue to run the lamp in a safe mode of operation.

- **Ballasts for luminaires with 1 lamp:** automatic restart after lamp is replaced.
- **Ballasts for luminaires with 2 lamps:**
  - PC 2x14 T5 TEC automatic restart after lamp is replaced.
  - PC 2x28 T5 TEC restart after mains reset.
- **Ballasts for luminaires with 3 and 4 lamps:** restart after mains reset.

T5 lamp information



14 W	549 mm
21 W	849 mm
28 W	1149 mm

Isolation and electric strength testing of luminaires
Electronic devices can be damaged by high voltage. This has to be considered during the routine testing of the luminaires in production.

According to IEC 60598-1 Annex Q (informative only!) or ENEC 303-Annex A, each luminaire should be submitted to an isolation test with 500 V_{DC} for 1 second. This test voltage should be connected between the interconnected phase and neutral terminals and the earth terminal.
The isolation resistance must be at least 2 MΩ.

As an alternative, IEC 60598-1 Annex Q describes a test of the electrical strength with 1500 V_{AC} (or 1.414 x 1500 V_{DC}). To avoid damage to the electronic devices this test must not be conducted.

Glow-wire test
according to EN 61347-1 with increased temperature of 850 °C passed.
